1 - CSS inside your head

1. Create an HTML page with:
   - One H1 heading
    - Two paragraphs
    - one image
    - (not sure what to do - code is [here](#))

    It should look something like this:

    Carrot is good for your brain

    If you eat a lot of carrots you will become sharper

    This is my bugs bunny has so many good advice

2. Add CSS
    - Change the heading using CSS:
        - Set the font size to 50 points.
        - Set the text to be all in uppercase (not sure how? See [this link](#))
    - Style the paragraphs:
        - Text should be centered
        - The background should be blue
    - Modify your image:
        - The image should have rounded borders
        - Change the height and width of the image to 30%.

    It should something like this:

CARROT IS GOOD FOR YOUR BRAIN

If you eat a lot of carrots you will become sharper

This is my logo bunny has so many good advice.

(Not sure what to do? Code is [here](#))

2 - CSS in a file of its own

1. Put CSS in a different file:
   a. Create a file named "my_style.css"
   b. Cut-and paste the styling you had in the html file and put it into your CSS file.
   c. Refer to your style file from your html (add a <link> tag in your html tag, linking to your CSS).
   d. Make sure the new configuration looks exactly like when the styling was in the HTML.
2. Add some styling features:
   a. Change the font in all elements of the page to Arial (by selecting the <body>).
   b. Change the background of the page to an image you like.

(Not sure what to do? Code is [here](#))

3 - Advanced selectors

Use your CSS file to:
1. Give the text in the heading and the first paragraph the same color using a `class`.
2. Add an underline to the the text of the second paragraph using an `id`.
3. Align the second paragraph and the image to the center using a `div`.

(not sure what to do? Find a solution [here](#))
